# Doom Emacs Cheat Sheet

Blogging and images

Shortcuts follow this configuration's **non-Evil** bindings. `C-` means Ctrl; `M-` means Alt/Meta. Run named commands with `M-x`.

## Create a Hugo blog post

1. Press `C-c n n h` (`org-capture`, then template `h`) and enter a title.
2. Fill in the description, then `C-c C-c` (`org-capture-finalize`). Capture takes you to the new entry; replace `<write here>` with the body. To cancel capture instead: `C-c C-k` (`org-capture-kill`).
3. With point inside the post, export with `C-c C-e H H` (`org-hugo-export-wim-to-md`). Both H keys are uppercase.
4. Keep `TODO` or `DRAFT` while writing. When ready, use `C-c C-t` (`org-todo`) to select `DONE`, then export again. Export creates Markdown; it does not deploy the site.

**Where it goes:** under `Ideas` in `~/Personal/websites/zzamboni.org/content-org/zzamboni.org`. The template creates an ID, a dated bundle (`YYYY-MM-DD-title-slug`), and `EXPORT_FILE_NAME: index`. The inherited section is `post`, so output goes to `content/post/<bundle>/index.md` in the Hugo site.

**Before exporting:** review `EXPORT_HUGO_CUSTOM_FRONT_MATTER` in the property drawer: the template defaults to `:featured_image /images/tram-zurich.jpg` and `:toc false`. Edit these for the post. `TODO` / `DRAFT` export as drafts; `DONE` exports as non-draft.

## Insert images into posts or Org documents

Place point beneath the appropriate heading (inside the post for Hugo).

- **Clipboard image:** copy the image itself, then `C-y` (`zz/org-smart-yank`) and supply a filename. In graphical Emacs this calls `yank-media` for PNG/JPEG/WebP/GIF; otherwise it uses `org-yank`. `M-x yank-media` explicitly invokes media paste. `C-u C-y` forces normal Org yank when the clipboard also contains an image.
- **Existing file:** `C-c C-a c` (`org-attach`, then copy), select the image, then `C-c C-l` (`org-insert-link`) and select the stored attachment link. Leave its description empty to display the image rather than link text.
- **Image URL:** `C-c C-a u` (`org-attach-url` via the attachment menu), enter the direct image URL, then insert the stored link with `C-c C-l`.
- **Drag and drop:** drop an image file into the Org buffer; your setup attaches it automatically.
- **Show/hide previews:** `C-c C-i` (`org-toggle-inline-images`) (also `C-c TAB` or `C-c C-x C-v`). Buffer previews are capped at 300 pixels; this is not an export size setting.

Attachments live in `attachments/` beside the Org file, partitioned by ID. Child headings inherit the post's ID. Keep this directory with the source; inserted links look like `[[attachment:photo.png]]`. Export the Hugo post again after adding images.

## Show or hide invisible text

`C-c t v` (`M-x visible-mode`) toggles visible mode in the current buffer. Enable it to reveal normally hidden text; press it again to restore hiding.

## Print this sheet / extend it

`C-c C-e l o` exports to PDF and opens it (`org-latex-export-to-pdf` exports without opening). A working LaTeX installation is required. Add each new use case as a top-level heading, with a short procedure and both shortcuts and command names.
